

## EE6316 Fields and Waves

### Homework Assignment #1 Solutions

Due on: Tue, Feb 21, 2006  
Prepared by: Masa Asahara, TA  
Approved by: Dr. MacFarlane, Instructor

#### 4. Balanis, Chapter 1, page 33, #1.5

The instantaneous E-field is

$$\mathbf{e}(x, y, z; t) = \text{Re} \left[ \mathbf{E}(x, y, z) e^{j\omega t} \right] \quad (1.1)$$

, where

$$\mathbf{E}(x, y, z) = \hat{\mathbf{a}}_x A(x+y) + \hat{\mathbf{a}}_y B(x-y) \quad (1.2)$$

is a phasor. Since the medium is source-free,

$$\nabla \cdot \mathbf{D} = \rho = 0 \quad (1.3)$$

$$\mathbf{D} = \varepsilon_0 \mathbf{E} \quad (1.4)$$

$$\begin{aligned} \nabla \cdot \mathbf{D} &= \varepsilon_0 \nabla \cdot \mathbf{E} = \frac{\partial}{\partial x} [A(x+y)] + \frac{\partial}{\partial y} [B(x-y)] \\ &= A - B = 0 \end{aligned} \quad (1.5)$$

## 5. Balanis, Chapter 1, page 35, #1.14

The instantaneous E-field is

$$\mathbf{e}(x, y, z; t) = \text{Re} \left[ \mathbf{E}(x, y, z) e^{j\omega t} \right] \quad (1.6)$$

, where

$$\mathbf{E}(x, y, z) = \hat{\mathbf{a}}_y E_0 \sin\left(\frac{\pi x}{a}\right) e^{-j\beta_z z} \quad (1.7)$$

is a phasor.

### (a) Instantaneous H-field

From Faraday's law,

$$\nabla \times \mathbf{E} = -j\omega\mu\mathbf{H} \quad (1.8)$$

$$\begin{aligned} \nabla \times \mathbf{E} &= \begin{vmatrix} \hat{\mathbf{a}}_x & \hat{\mathbf{a}}_y & \hat{\mathbf{a}}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 0 & E_y & 0 \end{vmatrix} = \left( -\frac{\partial}{\partial z} E_y \right) \hat{\mathbf{a}}_x + \left( \frac{\partial}{\partial x} E_y \right) \hat{\mathbf{a}}_z \\ &= \left( j\beta_z E_0 \sin\left(\frac{\pi x}{a}\right) e^{-j\beta_z z} \right) \hat{\mathbf{a}}_x + \left( E_0 \left( \frac{\pi}{a} \right) \cos\left(\frac{\pi x}{a}\right) e^{-j\beta_z z} \right) \hat{\mathbf{a}}_z \end{aligned} \quad (1.9)$$

$$\mathbf{H} = \left( \frac{-\beta_z}{\omega\mu} E_0 \sin\left(\frac{\pi x}{a}\right) e^{-j\beta_z z} \right) \hat{\mathbf{a}}_x + \left( \frac{e^{j\pi/2}}{\omega\mu} E_0 \left( \frac{\pi}{a} \right) \cos\left(\frac{\pi x}{a}\right) e^{-j\beta_z z} \right) \hat{\mathbf{a}}_z \quad (1.10)$$

The instantaneous H-field is

$$\begin{aligned} \mathbf{h}(x, y, z; t) &= \text{Re} \left[ \mathbf{H}(x, y, z) e^{j\omega t} \right] \\ &= \left( \frac{-\beta_z}{\omega\mu} E_0 \sin\left(\frac{\pi x}{a}\right) \cos(\omega t - \beta_z z) \right) \hat{\mathbf{a}}_x \\ &\quad + \left( \frac{1}{\omega\mu} E_0 \left( \frac{\pi}{a} \right) \cos\left(\frac{\pi x}{a}\right) \cos\left(\omega t - \beta_z z + \frac{\pi}{2}\right) \right) \hat{\mathbf{a}}_z \end{aligned} \quad (1.11)$$

The z-component of the H-field is ahead of the x-component by  $\pi/2$  in phase.

### (b) Phase constant $\beta_z$

Referring ahead to Chapter 8 on page 354 of the book,

$$\beta_x^2 + \beta_y^2 + \beta_z^2 = \beta^2 = \omega^2 \mu_0 \epsilon_0 \quad (1.12)$$

, where, in this particular case,  $\beta_y = 0$  and

$$\beta_x = \frac{\pi}{a} \quad (1.13)$$

So,

$$\beta_z = \sqrt{\omega^2 \mu_0 \epsilon_0 - (\pi/a)^2} \quad (1.14)$$

**6. Balanis, Chapter 2, page 96, #2.1**

$$\mathbf{E} = \hat{\mathbf{a}}_y 2 \text{ (V/m)} \quad (1.15)$$

$$\mathbf{P} = \hat{\mathbf{a}}_y 2.762 \times 10^{-11} \text{ (C/m}^2\text{)} \quad (1.16)$$

with the cross sectional area of

$$A = 2.4 \times 10^{-3} \text{ (m}^2\text{)} \quad (1.17)$$

**(a)**

$$\sigma_{pol} = |\mathbf{P}| = 2.762 \times 10^{-11} \text{ (C/m}^2\text{)} \quad (1.18)$$

**(b)**

$$Q_{pol} = \sigma_{pol} A = 6.63 \times 10^{-14} \text{ (C)} \quad (1.19)$$

**(c)**

$$q_{vp} = 0 \text{ (C/m}^3\text{)} \quad (1.20)$$

**(d)**

$$P = \chi \epsilon_0 E \quad (1.21)$$

Solving this for  $\chi$

$$\chi = \frac{P}{\epsilon_0 E} = \frac{2.762 \times 10^{-11} \text{ (C/m}^2\text{)}}{2 \text{ (V/m)} \times 8.854 \times 10^{-12} \text{ (F/m)}} = 1.56 \quad (1.22)$$

The dielectric constant comes out to be

$$\epsilon_r = \chi + 1 = 2.56 \quad (1.23)$$

## 7. Balanis, Chapter 2, page 97, #2.4

Figure 1: A parallel-plate capacitor partially filled with a dielectric

The parallel plates of an area

$$A = 2 \times 10^{-2} \text{ [m}^2\text{]} \quad (1.24)$$

are  $d_1 + d_2$  in spacing, where

$$d_1 = 2.5 \times 10^{-4} \text{ [m]} \quad (1.25)$$

$$d_2 = 1 \times 10^{-3} \text{ [m]} \quad (1.26)$$

Consider a case of free space with no dielectric in there. The capacitance of free space is

$$C_0 = \epsilon_0 \frac{A}{d} = 8.854 \times 10^{-12} \times \frac{2 \times 10^{-2}}{1.25 \times 10^{-3}} = 1.42 \times 10^{-10} \text{ [F]} \quad (1.27)$$

and a static charge is

$$Q_0 = C_0 V_0 = (1.42 \times 10^{-10})(100) = 1.42 \times 10^{-8} \text{ [C]} \quad (1.28)$$

So, the electrostatic energy is

$$U_0 = \frac{1}{2} C_0 V_0^2 = \frac{1}{2} (1.42 \times 10^{-10})(100)^2 = 7.1 \times 10^{-7} \text{ [J]} \quad (1.29)$$

The E-field in free space is

$$E_0 = \frac{V_0}{d} = \frac{100}{1.25 \times 10^{-3}} = 8 \times 10^4 \text{ [V/m]} \quad (1.30)$$

So, the energy density comes out to be

$$\frac{1}{2} \epsilon_0 |E_0|^2 = \frac{1}{2} (8.854 \times 10^{-12}) (8 \times 10^4)^2 = 2.83 \times 10^{-2} \text{ [J/m}^3\text{]} \quad (1.31)$$

The total energy is therefore

$$U_0 = \left( \frac{1}{2} \epsilon_0 |E_0|^2 \right) (Ad) = (2.83 \times 10^{-2}) (2.5 \times 10^{-5}) = 7.1 \times 10^{-7} \text{ [J]} \quad (1.32)$$

, which agrees with (1.29) as expected.

Now let a dielectric slab slide in as shown in Figure 1. Applying the Gauss's law to the closed surface S0

$$E_0 = \sigma_0 / \epsilon_0 \quad (1.33)$$

and to the closed surface S

$$E - E_0 = \sigma_{pol} / \epsilon_0 \quad (1.34)$$

From the KVL

$$E + E_0 (0.25) = 10^5 \quad (1.35)$$

The polarization vector

$$\epsilon_r = \chi + 1 = 5 \quad (1.36)$$

$$\chi = 4 \quad (1.37)$$

$$|\mathbf{P}| = \chi \epsilon_0 |\mathbf{E}| = |\sigma_{pol}| = -\sigma_{pol} \quad (1.38)$$

We have four equations with four unknowns:

$$\begin{pmatrix} \epsilon_0 & 0 & -1 & 0 \\ -\epsilon_0 & \epsilon_0 & 0 & -1 \\ 0 & 4\epsilon_0 & 0 & 1 \\ 0.25 & 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} E_0 \\ E \\ \sigma_0 \\ \sigma_{pol} \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 10^5 \end{pmatrix} \quad (1.39)$$

**(a) (b) (c) (d)**

Solving this for unknowns, we find

$$E_0 = 2.22 \times 10^5 \text{ [V/m]} \quad (1.40)$$

$$E = 4.44 \times 10^4 \text{ [V/m]} \quad (1.41)$$

$$\sigma_0 = 1.97 \times 10^{-6} \text{ [C/m}^2\text{]} \quad (1.42)$$

$$\sigma_{pol} = -1.57 \times 10^{-6} \text{ [C/m}^2\text{]} \quad (1.43)$$

The electric flux density in the air gap

$$D_0 = \epsilon_0 E_0 = 1.96 \times 10^{-6} \text{ [C/m}^2\text{]} \quad (1.44)$$

and the one in the dielectric

$$D = \epsilon_0 \epsilon_r E = 1.96 \times 10^{-6} \text{ [C/m}^2\text{]} \quad (1.45)$$

The normal component of the E-field flux density is continuous as expected. The charge stored on the plates

$$Q = A\sigma_0 = 3.94 \times 10^{-8} \text{ [C]} \quad (1.46)$$

(e)

The capacitance

$$C = Q/V_0 = 3.94 \times 10^{-10} \text{ [F]} \quad (1.47)$$

The voltage across the air gap

$$V_1 = E_0 d_1 = 5.55 \times 10^1 \text{ [V]} \quad (1.48)$$

and the one running across the dielectric

$$V_2 = E d_2 = 4.44 \times 10^1 \text{ [V]} \quad (1.49)$$

The capacitance can be thought of as a series combination of  $C_1$  and  $C_2$ , where  $C_1$ =capacitance across the air gap, and  $C_2$ =capacitance across the dielectric

$$\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2} \quad (1.50)$$

$$C_1 V_1 = C_2 V_2$$

Solving (1.50) for  $C_1$  and  $C_2$ ,

$$C_1 = 7.10 \times 10^{-10} \text{ [F]} \quad (1.51)$$

$$C_2 = 8.87 \times 10^{-10} \text{ [F]}$$

(f)

The energy density in free space

$$\frac{1}{2} \epsilon_0 |E_0|^2 = 2.18 \times 10^{-1} \text{ [J/m}^3\text{]} \quad (1.52)$$

and the one in a dielectric

$$\frac{1}{2} \epsilon_0 \epsilon_r |E|^2 = 4.36 \times 10^{-2} \text{ [J/m}^3\text{]} \quad (1.53)$$

The energy in free space

$$\frac{1}{2} \epsilon_0 |E_0|^2 (Ad_1) = 1.09 \times 10^{-6} \text{ [J]} \quad (1.54)$$

and the one in a dielectric

$$\frac{1}{2} \epsilon_0 \epsilon_r |E|^2 (Ad_2) = 8.72 \times 10^{-7} \text{ [J]} \quad (1.55)$$

The total energy is therefore

$$U = \left( \frac{1}{2} \epsilon_0 |E_0|^2 \right) (Ad_1) + \left( \frac{1}{2} \epsilon_0 \epsilon_r |E|^2 \right) (Ad_2) = 1.96 \times 10^{-6} \text{ [J]} \quad (1.56)$$
