Your first assignment will be to apply the Association Rules Mining technique we discussed in class to look for association rules in the following dataset: https://archive.ics.uci.edu/ml/datasets/STUDENT+ALCOHOL+CONSUMPTION. This page contains information about the dataset and the links to the data itself. Note that some of the variables in the dataset are numeric, so you will want to clean the dataset and create factors for all of the variables as we demonstrated in class. Look for good support, god confidence, and high lift. You should submit a short (less than 5 pages) report on what you found.

You may work in teams of two - please have one person submit the assignment, and clearly indicate both team members’ names on the front page. This assignment is due Sunday, June 5, at midnight.
